

Healthcare Operations Benchmarking & Risk Monitoring

An anonymized healthcare operations analysis showing how defined threshold rules, validation, benchmarking, and monitoring can turn complex operational data into clearer decision support.

CHALLENGE

Operational data from multiple nursing home communities and reporting periods needed consistent definitions, validation, and comparison rules before leaders could distinguish meaningful patterns from ordinary variation.

SOLUTION

Standardized source data, applied defined threshold rules to identify weight changes warranting closer review, created normalized benchmarks, compared communities and reporting periods, and translated multiple risk signals into priorities for operational follow-up.

WORKFLOW

WHAT WAS MEASURED

Weight monitoring

- Percent of residents with at least one defined weight-change event ($\pm 5\%$ over 30 days or $\pm 10\%$ over 180 days)
- Weight-change events per standardized resident count
- Median days between weigh-ins
- Percent exceeding the expected monitoring interval

Fall-related monitoring

- Repeat-fall rate within a defined follow-up window
- Falls per standardized resident count
- Median days between falls

WHAT THE ANALYSIS PRODUCED

Decision-support outputs

- Community-level benchmark tables and comparisons
- Period-over-period changes in monitoring cadence and event frequency
- Multiple-signal flags identifying communities for closer review
- Hypotheses for follow-up, including missingness or under-detection, staffing or process changes, seasonality, and case mix

Selected signals observed

Longer weigh-in intervals, higher weight-change event frequency, and meaningful variation in repeat-fall patterns.

VALUE

Structured rules, validated data, and comparable benchmarks improve operational decision support.

Decision support

Operational review

HOW THIS APPROACH CAN BE APPLIED

DOMAS can take messy operational data, make the rules and assumptions explicit, build trustworthy comparison logic, and translate the results into structured decision support.

Risk monitoring

Quality improvement

Portfolio note: Anonymized analytics case study; no raw resident-level data included. Not clinical guidance.
